# Basic Design Principles

**Superconducting  
Magnet Division**

- $Nb_3Sn$  Racetrack coils
- Design Field: 8+ T
- Nominal Operating Field 7 T
- **Decay products clear SC coils at midplane**
- Warm iron
- Compact cryostat
- Low cost

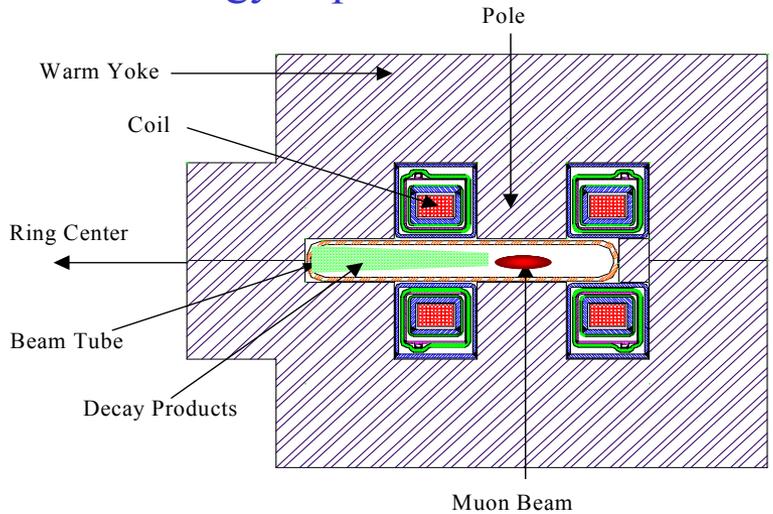

**Earlier Version**

# Dipole for $\nu$ Storage Ring

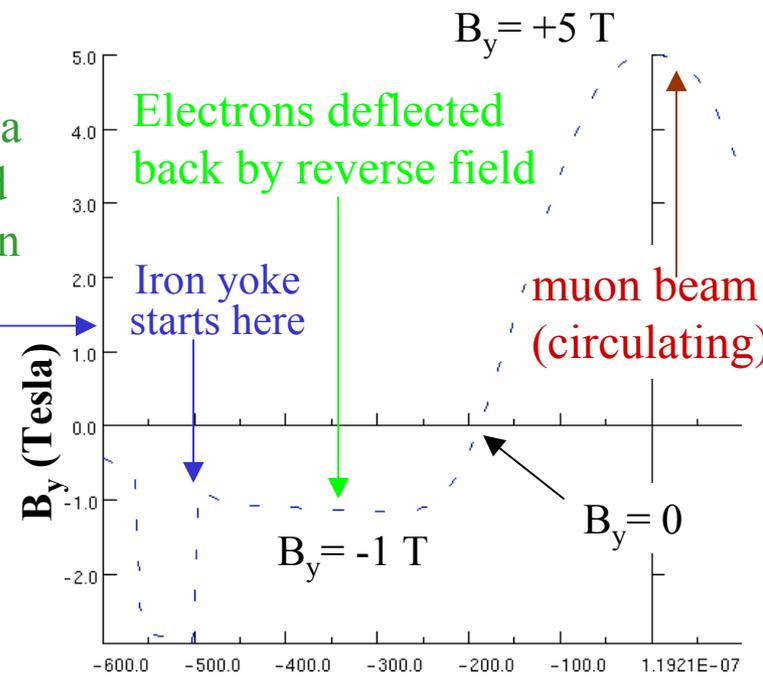

**Superconducting Magnet Division**

One major design consideration: Reduce the amount of energy deposited in cold structure

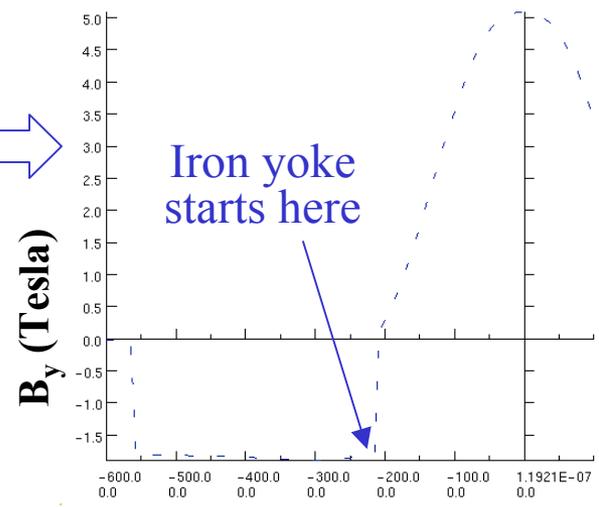

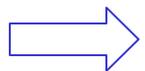

Decay electrons get back towards main aperture by (a) Reverse field and (b) Magnet saggitta which knob to use how much may depend on E & B

Design with a reverse field region in Iron

A dipole with no cutout in yoke for a reverse field region. Electrons will hit yoke and create shower

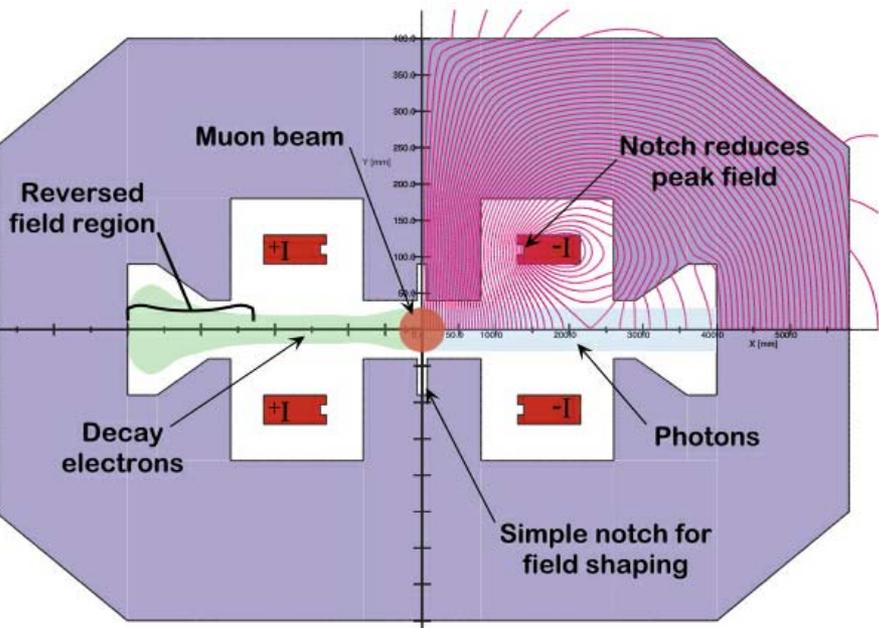

UNITS	
Length	: mm
Flux density	: T
Field strength	: A m <sup>-1</sup>
Potential	: Wb m <sup>-1</sup>
Conductivity	: S m <sup>-1</sup>
Source density	: A mm <sup>-2</sup>
Power	: W
Force	: N
Energy	: J
Mass	: kg

PROBLEM DATA	
A15X8-NOREV.FIELD.ST	
Quadratic elements	
XY symmetry	
Vector potential	
Magnetic fields	
Static solution	
Scale factor = 0.35	
11150 elements	
22363 nodes	
34 regions	

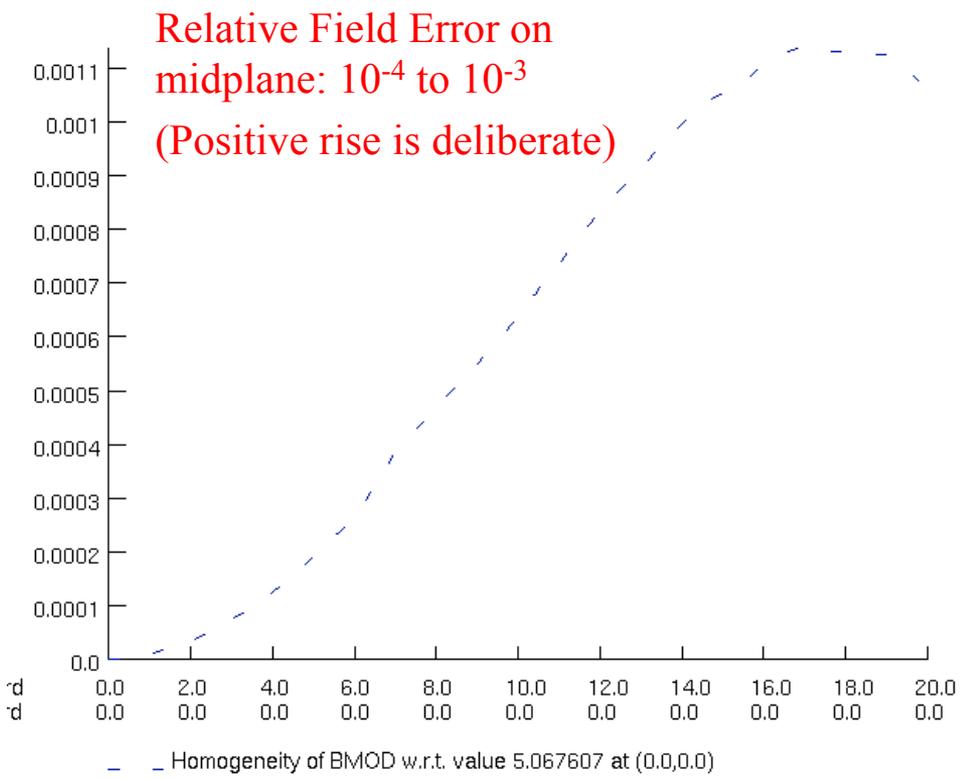

In neutrino storage ring, is ~10% energy deposition acceptable?

# Magnetically Optimized Design

Cutout in yoke to optimize field quality: Model used in MARS Studies (Brett Parker)

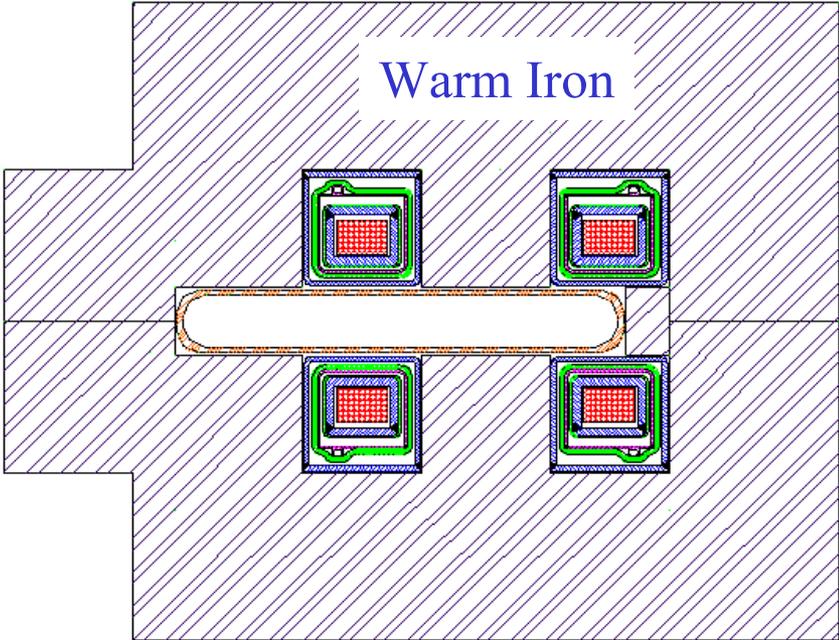

Toy model dipole with improved field harmonics and extended vertical cutout.

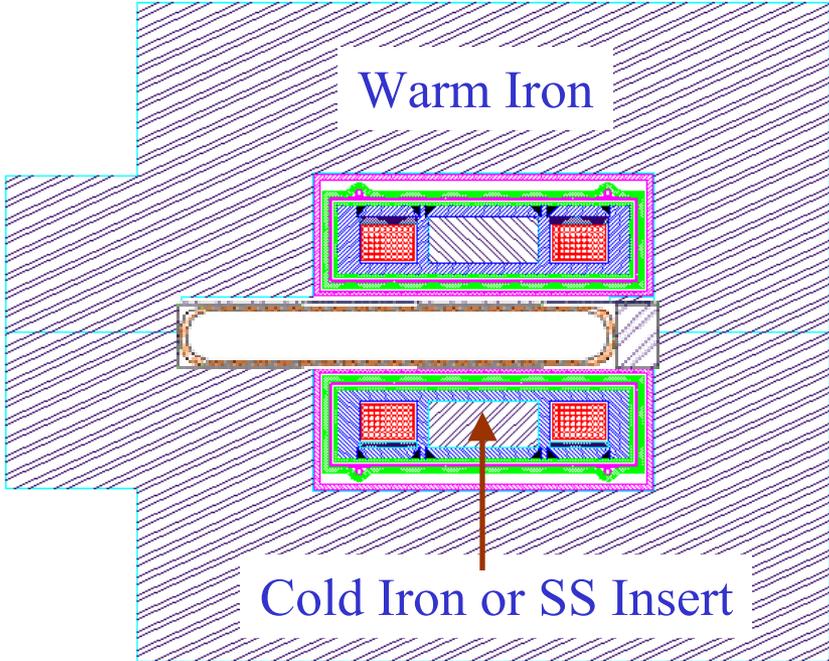

# Magnet Design Evolution

Common cryostat for two coil halves:  
For a better mechanical and cryogenic design

Earlier Version

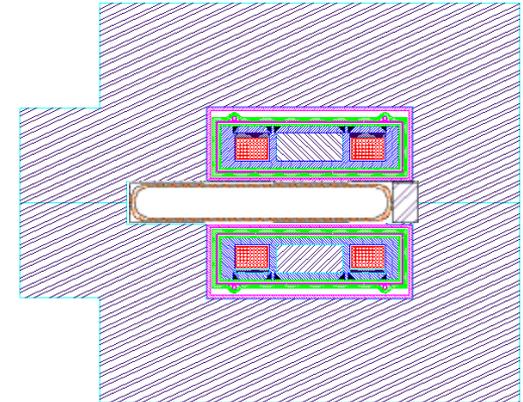

Current Version

# Future Design Work and Other Possibilities

Work on the present configuration continues on:

- Magnetic Design
- Mechanical Design
- Cryostat Design

More design evolution to be based on MARS Studies (Brett Parker)

- How many watts are actually deposited in coils, etc. under different scenarios?
- If not much, coils can tolerate a modest temperature rise and still be superconducting
  - The coils can be brought significantly down towards midplane for better efficiency
    - Higher field, lower forces.
- High Field Option (8-10 T Nb<sub>3</sub>Sn):
  - More R&D, other designs and technologies, more expansive
  - Another Benefit of Nb<sub>3</sub>Sn -- higher T<sub>c</sub>, allows higher heat deposition

In all cases coils are flat and clear bore tube (original design principles)

# Possibility of A Combined Function Magnet Design

Since, most energy deposition is on one side, the coil on other side can be brought closer to midplane, or one can have a “C magnet”. This generates a combined function magnet, actually with a higher field. But with only of one type of focussing. Imagine a lattice where long dipole have focussing of one kind and the other type of focussing comes from traditional quadrupoles. AP Issues?
